The Mean

Mean, median, and mode are three different kinds of averages. First, let's look at the mean, which is defined as adding all the numbers and then dividing by the number of numbers, or in other words, the average of a group of numbers. The words "mean", and "average" are often used interchangeably. In statistics, the mean indicates the average that describes the center of a frequency distribution

Let's see how the mean is calculated. These numbers represent how many students received a certain grade, A, B, C, D, E, or F. To calculate the mean, you would add the numbers associated with each grade and then divide by the number of types of grades.
